a
From jump measurement to a controlled synthetic benchmark
1 Measure
CMJ force–time:
mean force (N/kg),
net impulse (m/s)
2 Expose
training exposure,
baseline, time since
exposure
3 Respond
fixed 24 h / 84 h
mathematical modes
(synthetic assumption)
4 Simulate
one generator:
camps, episodes,
three horizons
5 Forecast
baseline-relative
innovations at
H24 / H48 / H72
Two separate bodies of work answer different questions
Original neural architectures M0–M8
9 families × 2 repeats = 18 routes
structure, inputs, parameter counts, CPU/GPU
numerical qualification
NO public predictive-performance comparison
Public synthetic experiment
4 evaluated reference models: zero innovation,
training mean, ridge, structured fixed-mode
six-cell NRMSE · camp-bootstrap · ablations
nested training camps · 3 same-generator roots
